## Homework

Encrypt the first three letters of your first name in uppercase letter

**ENCRYPTION TYPE: RSA** 

PUBLIC KEY: n = 187, e=3 (to encrypt)

PRIVATE KEY: p=11, q=17, d=107 (to decrypt)

\*Background information: pxq=n (11x17=187)

p, q - chosen prime numbers, the bigger the better, more secure

e - chosen prime number

m - message to encrypt in corresponding ASCII code

c - ciphered text (me mod n)

## **ASCII Table:**

| Α  | В  | С  | D  | E  | F  | G  | н  | 1  | J  | K  | L  | М  |
|----|----|----|----|----|----|----|----|----|----|----|----|----|
| 65 | 66 | 67 | 68 | 69 | 70 | 71 | 72 | 73 | 74 | 75 | 76 | 77 |
| N  | 0  | Р  | Q  | R  | s  | Т  | U  | ٧  | w  | x  | Υ  | Z  |
| 78 | 79 | 80 | 81 | 82 | 83 | 84 | 85 | 86 | 87 | 88 | 89 | 90 |

| ENCRYPTION  |                                 | _                      |                         |                        |  |
|---|---------------------------------|------------------------|-------------------------|------------------------|--|
| Instructions  | Example: H                      | First Letter: [letter] | Second Letter: [letter] | Third Letter: [letter] |  |
| 1. Find the corresponding ASCII code to your letter | 72 E - 69                       |                        | R - 82                  | I - 73                 |  |
| 2. Calculate m <sup>e</sup>                         | 72 <sup>3</sup> = <b>373248</b> | 328509                 | 551368                  | 389017                 |  |
| 3. Find c = me mod n                                | 373248 mod<br>187 = <b>183</b>  | 137                    | 92                      | 57                     |  |
| 4. Your ciphered letter ( c value)                  | 183                             | 137                    | 92                      | 57                     |  |

| DECRYPTION                                  |  |                               |                      |                      |  |
|---|--|-------------------------------|----------------------|----------------------|--|
| Instructions                                | Example: 183                                 | Ciphered letter: 77           | Ciphered letter: 166 | Ciphered letter: 137 |  |
| Calculate m=c <sup>d</sup> mod n            | $m = c^{d} \mod n = 183^{107} \mod 187 = 72$ | M = 77 <sup>107</sup> mod 187 | M = 166^107 mod 187  | M = 137^107 mod 187  |  |
| 2. Convert m to letter based on ASCII table | 72 = <b>H</b>                                | 66 = B                        | 89 = Y               | 69 = E               |  |

Use <a href="https://www.wolframalpha.com/">https://www.wolframalpha.com/</a> to calculate modulo mathematics and huge exponents

**Extension**: Encrypt your full first name (add columns to the table above - right click on the table and choose "insert column right" option)

Use this code to check your work in the Homework above for Encryption ONLY:

```
import math

message = input("Enter the letter to be encrypted: ")
ascii_code = ord(message)

p = 11 #private key
q = 17 #private key
e = 3 #public key

n = p*q #public key

#Encryption, c = m^e mod n
def encrypt(msg):
    m_power_e = math.pow(msg,e) #calculates m to the power of e
    c = m_power_e % n #find modulo to get the ciphered text
    print("Encrypted Message is: ", c)
    return c

print("ASCII Code is: ", ascii_code)
c = encrypt(ascii_code)
```

## ASYNC:

Find another type of encryption and give a brief summary of how it works. Post on Slack and comment on one other person's post.
